Download

cannot connect to app id I am trying to use the skidrow app id on my server but I'm having an issue connecting to it. I've got my PHP7 app running as a website (mydomain.com) and I have a VPS with phpmyadmin. I've been following the documentation here I've created an app id in the skidrow app but am having trouble finding documentation on how to configure my VPS to use it. Can anyone point me to the documentation so I can get this working? A: Use this command to view the appid and location php artisan config:clear then php artisan config:clear-env After this command, restart the server sudo service apache2 restart Q:

What programming language is best for simulation of quantum computers? I am currently studying quantum computing. I am very much interested in simulating quantum computers. I have studied for programming languages and database systems. Could you help me what programming language or database system will be best for this? I would think about Haskell. It is a language where you use functional programming techniques. Also, it is typed which makes it easy to write very correct programs. Haskell is very well suited for computer simulation. It provides some already defined functions like e.g. the lattice algorithm. You will have a look at the K computer simulator, which is written in Haskell. It is used by a lot of universities and scientific research to simulate quantum computers. Is Google Bigquery designed as OLTP? We are considering using google bigquery for ETL purposes. This will be used to move and upload data from various sources like MySQL, MongoDB, DynamoDB and eventstore. Will it be suitable for OLTP purposes? Yes. Bigquery is designed as a data warehouse for OLTP. The data can be transported to the data warehouse via a data pipeline, as well. Data pipelines (also known as data streams or real time pipelines) is a feature in Bigquery that allows you to copy data in real time from one data source to another. You can do so by configuring the data pipeline to check the schema of the source and create the destination with the source schema and then update the destination
